

# Fall Planted Pansies & Tulips!

[print\_link]

Fall planted Pansies and & Tulips really dazzle in Georgia in April. These pansies were planted about the first of October. The addition of some slow release fertilizer to the soil at planting will help promote flowering during the remainder of the fall, winter, and spring. The addition of a mulch material in between the plants after planting will reduce potential weed infestations. When picking the bedding plant flats at the nursery try to pick the most fully grown, well rooted and healthy plants you can find. We will let these bloom until late May or early June and then we will replace them with a summer bedding plants.
